

Date _____

NAME: Magsood Ahmed

ID: 38186

PROGRAM: BS (CS)

ASSIGNMENT: "Paraphrasing"

Body Language:

Humans and animals communicate in different ways. We use words to talk, while animals make sounds. Dolphins and whales have their own language using high-pitched sounds.

Beside words, we also use body language to communicate. This includes our facial expressions, how we stand, and the movements we make.

Body language helps us understand the meaning behind words.

Let's compare two situations. In the first one, you playfully throw a rubber snake at your brother and say, "I hate you" with a smile. In the second situation, you angrily throw the snake at him and yell the same words. Although the words are the same, the body language is different. This shows how body language can change the meaning of words.

To sum up, humans and animals communicate through words and sounds. Body language, like facial expressions and posture, adds meaning to our words. It's important to be aware of body language and to influence others. Skilled actors and poker players know how to use their body language to convey different emotions and intentions.
